

DOES THE MAKE NATURAL POWER GUIDE ACTUALLY WORK?

Over the past year a lot of diy energy guides have appeared on the internet, promising to teach even a complete technical newbie how to make their own home solar and wind power, and reduce their energy bills by up to 80%. One those guides happens to be Make Natural Power. But does it deliver what is promises? And is how does it stack up to the other guides?

The best thing about Make Natural Power is its cover. Everything beyond that was disappointing to say the least. Although it appears to have all the features of the the other guides, the information is very thin and not well-explained.

Good Aspects:

You will be able to build a solar and wind power system, but it will take you a very long time, unless you have great technical skills.

Dislikes

* Poor diagrams

The illustrations did not go well with the instructions. Labels were missing, the scaling was out, and the pictures were just plain boring.

* Useless solar power

The instructions were not easy to follow, and the illustrations did not help either. Because of this, the reader is required to figure things out on their own, resulting in a useless solar panel system, if it ever gets finished.

* Incomplete maintenance instructions

While I eventually got my wind generator to work, it ended up breaking after 2 months. This could have been prevented if I was given correct advice on how to effectively maintain the wind turbine.

* Customer support is really slow

A lot of the time we had to contact customer service for assistance. But they were very slow to respond, and by the time they did reply we had either forgotten what the problem was or had figured it out ourselves. On average, it will take over 5 days to get the answers you need.

Conclusion

If you are willing to get a cheap knock-off of Earth4Energy, but for the same price, then by all means get the Make Natural Power guide. The book was terribly written, the instructions were confusing, and it was not a pleasant experience for me
