

PROS AND CONS OF SOLAR ENERGY

The more you understand about any subject, the more interesting it becomes. As you read this article you'll find that the pros and cons of solar energy are certainly no exception.

The purpose of solar energy is to harness the sun's power and convert it into electricity. Solar energy is probably the most common form of alternative power for everyday people and you can see solar lights and other solar accessories in many gardens. Governments are beginning to offer grants to assist in paying for photovoltaic roof tiles; these tiles are easily fitted onto your roof and collect the heat from the sun.

Fuel cells, which use hydrogen and oxygen to produce electricity, are an attractive resource-efficient energy source, with a range of applications in the automotive industry, portable electronics, domestic heating, and power generation. While there are many technical problems to be overcome, there are also wider system issues that mark out fuel cell technology as a case of radical, disruptive innovation.

It seems like new information is discovered about something every day. And the topic of the pros and cons of solar energy is no exception. Keep reading to get more fresh news about the facts about solar energy.

Fuelled largely by such orders, the solar energy company expects revenues to double in

2009 from \$8 million last year. Fuel cells have the potential to dramatically change how the military carries out its missions, and how soldiers operate in the field. With the largest, most technologically advanced military in the world, the U.S.

Photovoltaic cells are being increasingly used to tap into this huge resource and will play a key role in future sustainable energy systems. So far, solid-state junction devices, usually made of silicon, crystalline or amorphous, and profiting from the experience and material availability resulting from the semiconductor industry, have dominated photovoltaic solar energy converters. Photovoltaic system costs encompass both module and BOS costs. Module costs typically represents only 40-60% of total PV system costs.

Alternative energy developed as a profit center independent of tax subsidies, benefited by tax credits and incentives would be laudable and perhaps someday will be competitive with fossil fuels and worthy of investment dollars. But this panic over fossil fuels running out or producing carbon emissions and contributing to global climate change is irresponsible scientific consensus posturing as religion.

You can't predict when knowing something extra about the pros and cons of solar energy will come in handy. If you learned any new facts about solar energy in this article, you should file the article where you can find it again.
