

HOW TO CONNECT WITH AVAILABLE NETWORK & TELECOMMUNICATION

The two most popular networks available in the market are wireless network and wired network. Wired network is a network which is available to a device with the help of connectivity through some wire or a cable. Whereas, a wireless network is a connection which does not need any wire to connect computer with the connection nodes.

The wireless network is gaining its popularity due to the following reasons:

Convenience. Wireless network has made network accessibility quite easy and feasible irrespective of location.

Mobility. People are no more stick to their desk. The online availability is possible in all the corners of the work area which include the places like warehouse.

Productivity. Undoubtedly, today we can see and feel the staff encouraging collaborations which is playing a very important role in increasing productivity.

Easy Setup. Some of the features of the wireless connection are: its installation which is not only cost effective but is also hassle free and quick.

Expandable. Wireless connections can be easily expanded to the existing equipments.

Security. The provision of robust security protection is available in the wireless network connection.

The businesses both big and small are finding all the reasons of going wireless.

Some of them are as follows:

- Anytime anywhere access has made better access to information.
- It has increased mobility and collaboration which have further increased the productivity.
- An increase in the level of customer satisfaction.
- In many businesses like hospitality this act as a value added services, as it can enhance the guest access.

How to connect with the available wireless network

- Today the laptops available in the market have built in wireless networking connection. One need not worry if it is not there. The wireless network adapter card can be installed in the computer easily. It is both inexpensive and easy to use.
- Many network routers today are capable of wireless networking.

- Avoid over sharing of access points.
- A vital concern in wireless network is security.

The various measures suggested for the security are as follows:

User authentication

Secure access for any kind of visitors and guest

Control systems

Data encryption

Today the world is globalized and people are always looking for the easiest and the cheapest way of communication both at national and international level. With this growing demand both network and telecommunication has to play an important role in the term of advancement. The various network and telephone equipments are available in the market like phone cards, GPS System etc. Even the network equipment suppliers and the telecommunication equipment suppliers are facing a tough competition due to the high market demand. These suppliers are continuously competing in terms of prices and services in the market.
