

HOW TO EDIT FILES USING NOTEPAD++ OVER SSH FILE TRANSFER PROTOCOL

Notepad++ is a GPL licensed source code editor for Windows operating system. I use it rarely due to Linux related habits, but my friends are using it all the time, so there must be something about it. Taking this into account, I will briefly describe how to edit files using this editor over SSH File Transfer Protocol.

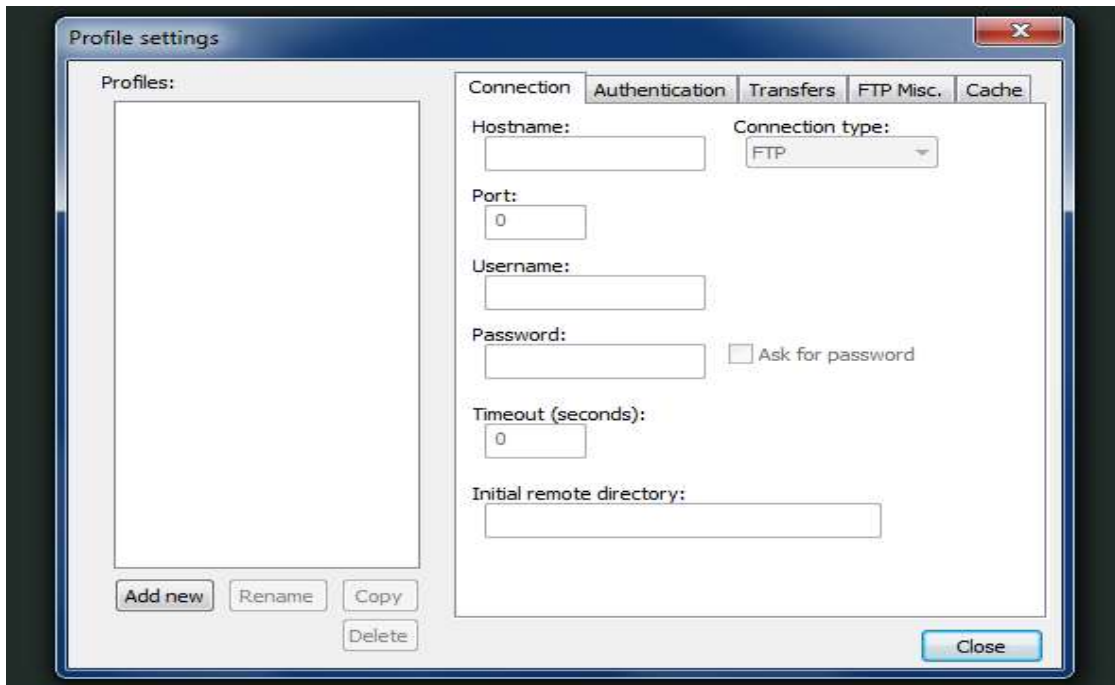

Open *Plugins > NppFTP > Show NppFTP Window* menu.

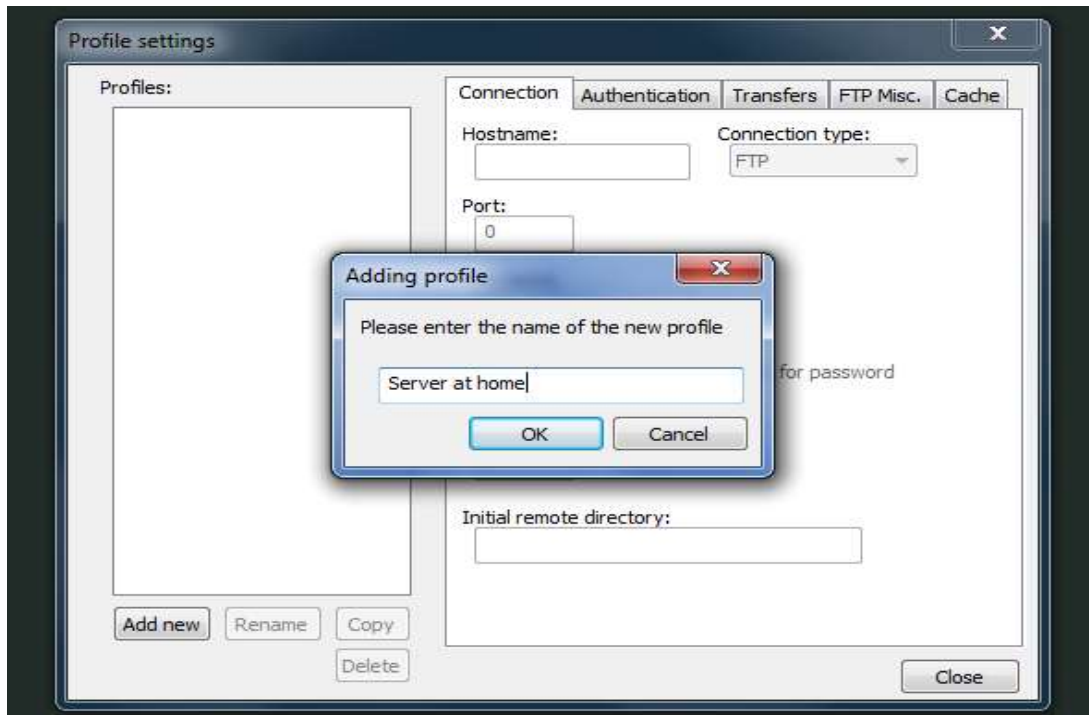

Select *Settings > Profile settings* in *NppFTP Window*.

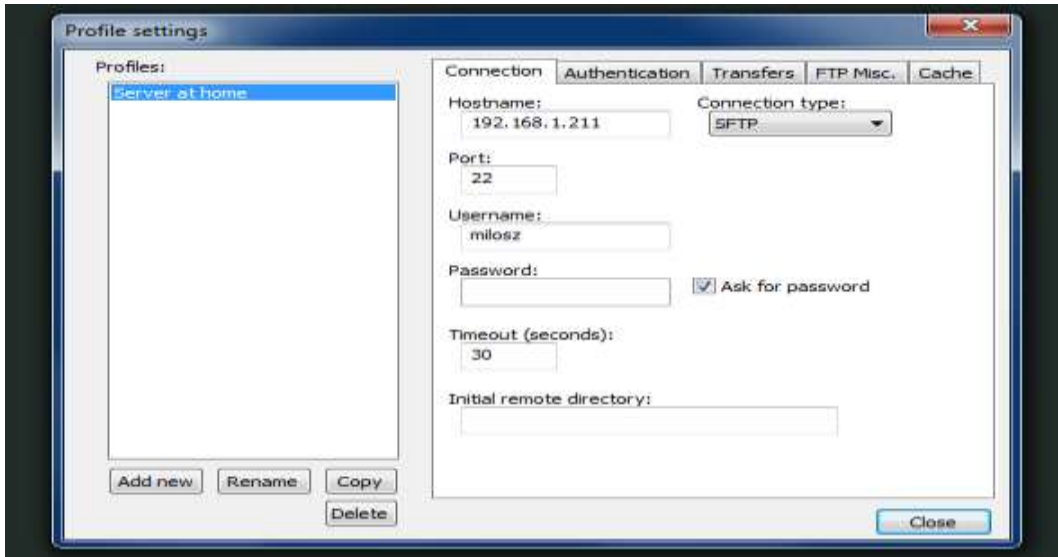

Add new profile.

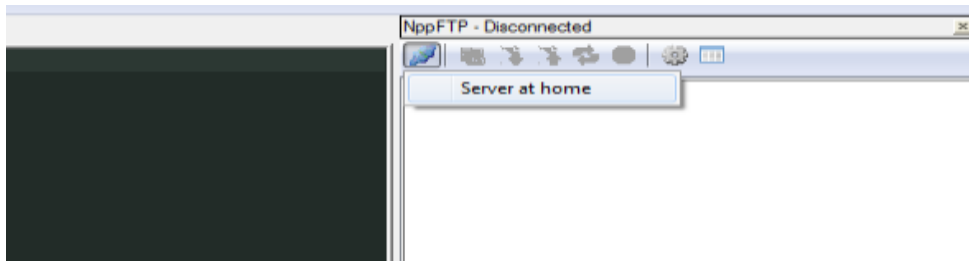

Provide a name for new profile.

Provide *IP address*, *connection type* and *username*. Close window afterwards.

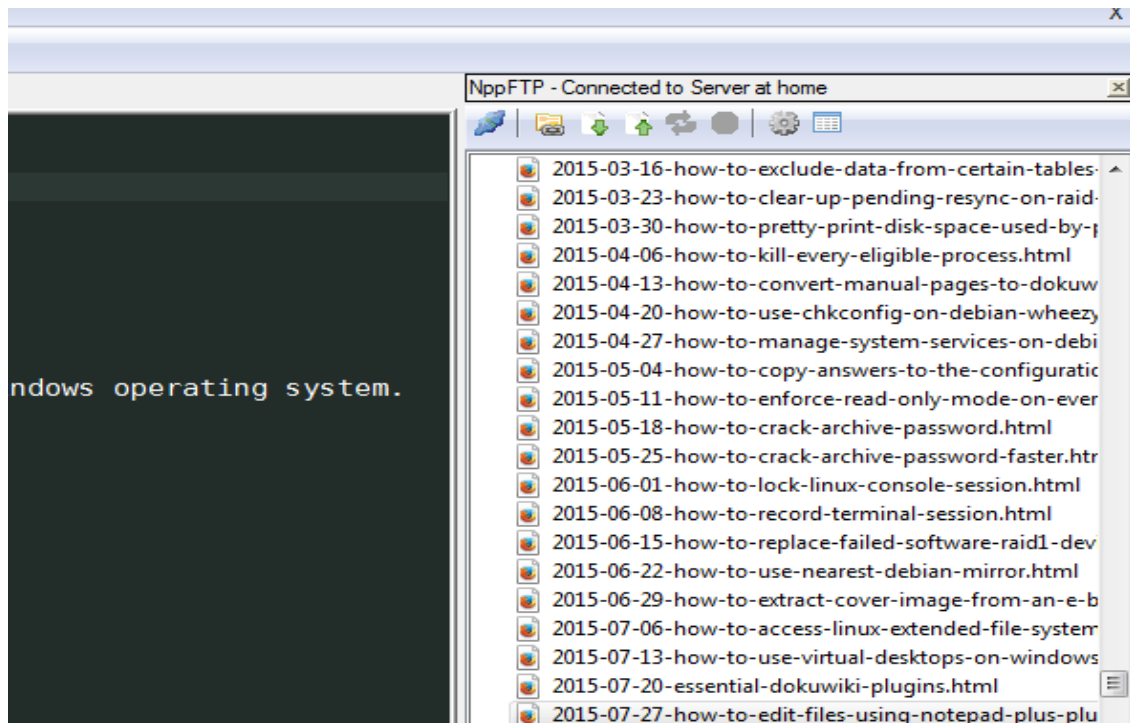

Choose profile from *Connect* menu.

Enter password.

Access files on remote server.

Done.
