

HOW TO FIX ERROR WHEN MOVING EVENTS BETWEEN CALENDARS

Recently, I noticed "*Failed to save changes*" error when tried to move events between distinct calendars. After a short investigation I found that this bug is already fixed, but not packaged for an easy upgrade, so I will shortly describe how to apply fix for **Debian Wheezy** and **Kolab 3.3**.

The above-mentioned bug is already fixed in roundcubemail-plugins-kolab repository. You can jump directly to the [a3d5f717](#) commit and read details.

Quick Remedy

We need to replace `calendar` and `libkolab` plugins.

Download code from already fixed `roundcubemail-plugins-kolab` repository to `/tmp` temporary directory.

```
# cd /tmp  
  
# wget http://git.kolab.org/roundcubemail-plugins-kolab/snapshot/roundcubemail-plugins-kolab-a3d5f717a2250cfbd7a5652a445adcd6a0845545.tar.gz
```

Rename mentioned *roundcubemail plugins* directories that will be replaced in next step.

```
# mv /usr/share/roundcubemail/plugins/{calendar,calendar.before_fix}  
  
# mv /usr/share/roundcubemail/plugins/{libkolab,libkolab.before_fix}
```

Extract both plugins from downloaded archive.

```
# tar xvfz roundcubemail-plugins-kolab-a3d5f717a2250cfbd7a5652a445adcd6a0845545.tar.gz  
roundcubemail-plugins-kolab-  
a3d5f717a2250cfbd7a5652a445adcd6a0845545/plugins/{calendar,libkolab} --strip-components  
2
```

Install and configure plugins.

```
# mv {calendar,libkolab} /usr/share/roundcubemail/plugins/
```

```
# ln -s /etc/roundcubemail/calendar.inc.php  
  
/usr/share/roundcubemail/plugins/calendar/config.inc.php  
  
# ln -s /etc/roundcubemail/libkolab.inc.php  
  
/usr/share/roundcubemail/plugins/libkolab/config.inc.php
```

Remove downloaded archive.

```
# rm roundcubemail-plugins-kolab-a3d5f717a2250cfbd7a5652a445adcd6a0845545.tar.gz
```

Simple and easy.
